AGRICULTURE.

DEFINITIONS AND EXPLANATIONS OF TERMS.

Farm.—A "farm" for census purposes is all the land which is directly farmed by one person managing and conducting agricultural operations, either by his own labor alone or with the assistance of members of his household or hired employees. The term "agricultural operations" is used as a general term, referring to the work of growing crops, producing other agricultural products, and raising domestic animals, poultry, and bees. A "farm" as thus defined may consist of a single tract of land or of a number of separate and distinct tracts, and these several tracts may be held under different tenures, as where one tract is owned by the farmer and another tract is hired by him. When a landowner has one or more tenants, renters, croppers, or managers, the land operated by each is considered a "farm."

In applying the foregoing definition of a "farm" for census purposes, enumerators were instructed to report as a "farm" any tract of 3 or more acres used for agricultural purposes, and also any tract containing less than 3 acres which produced at least $250 worth of farm products in the year 1919, or required for its agricultural operations the continuous services of at least one person.

Farm population—definition.—The farm population, as the term is here used, includes all persons actually living on farms, without regard to occupation, and also those farm laborers (and their families) who, while not living on a farm, nevertheless live in strictly rural territory, outside the limits of any village or other incorporated place.

Farmer.—A "farmer" or "farm operator," according to the census definition, is a person who directs the operation of a farm. The number of farmers shown by the census of agriculture is, therefore, the same as the number of farms. Owners of farms who do not themselves direct the farm operations are not reported as farmers.

Tenure classification.—Farm operators are classified according to tenure as follows:

Farm owners include (1) farmers operating their own land only and (2) those operating both their own land and some land hired from others. The latter are sometimes referred to in the census reports as "part owners," the term "full owners" being used for those owning all the land which they operate.

Managers are farmers who are conducting farm operations for the owner for wages or a salary.

Farm tenants are farmers who, as tenants, renters, or croppers, operate hired land only. They were reported in 1920 in five classes: (1) Share tenants—those who pay a certain share of the products, as one-half, one-third, or one-quarter, for the use of the farm but furnish their own equipment and animals; (2) croppers—share tenants who do not furnish their work animals; (3) share-cash tenants—those who pay a share of the products for part of the land rented by them and cash for part; (4) cash tenants—those who pay a cash rental, as $7 per acre of crop land or $500 for the use of the whole farm; (5) standing renters—those who pay a stated amount of farm products for the use of the farm, as 3 bales of cotton or 500 bushels of corn. In some cases the character of the tenancy was not ascertained by the enumerator; such tenants are designated "unspecified."

Farm land.—Farm land is divided into (1) improved land, (2) woodland, and (3) other unimproved land.

Improved land includes all land regularly tilled or mowed, land in pasture which has been cleared or tilled, land lying fallow, land in gardens, orchards, vineyards, and nurseries, and land occupied by farm buildings.

Woodland includes all land covered with natural or planted forest trees which produce, or later may produce, firewood or other forest products.

All other unimproved land includes brush land, rough or stony land, swamp land, and any other land which is not improved or in forest.

Farm mortgages.—Three points should be kept in mind in using the census statistics for farm mortgages. First, the statistics are limited to farms operated by their owners, and no figures whatever are given for farms operated by tenants or hired managers. Second, the mortgage debt represented by the figures is that debt secured by real-estate mortgage, not including indebtedness secured by chattel mortgage, crop mortgage, or collateral or personal security. Third, while the figures representing the number of mortgaged farms include farms whose owners hire and operate some land in addition to that which they own, the statistics for the amount of the mortgage debt cover only those farms which consist wholly of land owned by the operator.

Live stock on farms.—The term "live stock," as it is used in the census reports, includes not only the common domestic animals (horses, mules, asses and burros, cattle, sheep, goats, and swine) but also poultry and bees. The figures for the value of live stock which are given in a number of the tables in connection with the value of other classes of farm property represent the value of the whole group as above defined. Certain totals are also given for domestic animals alone.

The comparability of the figures for live stock as reported for 1920 and 1910 is seriously affected by the change in the date of enumeration from April 15 in 1910 to January 1 in 1920. The 1910 census, by reason of its later date of enumeration, gained the large numbers of domestic animals born between January 1 and April 15, which would not have been reported, of course, if the census had been taken as of January 1. On the other hand, a group of considerable importance was omitted from the 1910 enumeration on account of the later date, namely, those animals which were sold or slaughtered (or which died) during the first 3½ months of the year—animals which were on the farms on January 1, 1910, but not on April 15. In most cases the gain from the animals born would considerably exceed the loss from animals marketed or otherwise disposed of. Hence the 1910 totals are, in general, somewhat too large for fair comparison with 1920, while the 1910 figures, omitting those animals born subsequent to January 1, 1910, are too small. This question is discussed in detail in the general reports of the census of agriculture.

Dairy cows.—Dairy cows, as reported for 1920, included all cows and heifers 2 years old and over kept mainly for milk production. The figures obtained under this classification are not closely comparable with the figures reported at the census of 1910, particularly because the age limits employed in 1910 included all cows and heifers 15½ months old and over on April 15, 1910 (1 year old and over on Jan. 1). An estimate of the number of dairy cows 2 years old and over on January 1, 1910, has been made, however, and is given in the tables.

Gross value of farm products.—The "gross value of farm products" which is shown in Table 210 is obtained by adding together the value of live-stock products, domestic animals sold or slaughtered, farm crops, forest products of farms, and nursery and greenhouse products. This figure corresponds approximately with the gross value of products for a manufacturing industry, and for many purposes forms a fairly satisfactory index of the progress of agriculture or of the relative importance of the agricultural industry in different areas. It contains, however, two serious elements of duplication. First, when the value of all crops produced is added to the value of all live-stock products, the value of the crops which are fed to live stock is duplicated. Second, in the total value of live stock sold there is duplication, because animals are frequently sold by one farmer to another and again sold by the second farmer. The duplication is more serious in the states where live-stock products form a large part of the total gross value than in those states where crops are the principal product.

[1] North Dakota and South Dakota admitted as states in 1889. Figures for 1880 obtained by consolidating data for the counties which then occupied the areas now known as North and South Dakota, respectively.
[2] The 1870 and 1860 figures are for Dakota Territory.

[1] Value of milk, cream, and butter fat sold, and of butter and cheese made on farms.
[2] Estimates have been made for incomplete reports, as where a farmer reported dairy cows but no milk production, or chickens but no egg production. Chicken eggs and chickens for 1909 also involve estimated deductions from the published figures of the Thirteenth Census, which included all eggs and all kinds of fowls raised.
[3] Figures for 1919 do not include "cheese sold," as that item was not reported for 1919. The value of cheese sold in 1909 was $987,974.
[4] Includes farms for which estimates were made.
[5] Value of all eggs produced. The estimated value of chicken eggs produced in 1909 was $303,296,012.
[6] Value of all fowls raised. The estimated value of chickens raised in 1909 was $184,902,527.

[3] The figures shown for 1919 represent the value of chicken eggs and chickens raised, while the 1909 figures include the value of the products of all kinds of poultry. The figures for both years represent the value of the total production, including estimates. The estimated value of chicken eggs produced in 1909 is shown in Table 123 and of chickens raised, in Table 124.

[1] The value of domestic animals sold or slaughtered was not called for by the 1920 farm schedule. The estimate of the 1919 value was based on the ratio between the animals sold or slaughtered in 1909 and those on hand in 1910, and the changes in the number and average value of comparable classes of animals from 1910 to 1920.

[1] Less than one-tenth of 1 per cent.
[2] Principally oats and barley, oats and wheat, and wheat and barley grown and harvested together.
[3] Includes castor beans, horse beans, and "other" beans.
[4] Includes broom-corn seed, hemp seed, mustard seed, sorghum seed, sunflower seed, and tobacco seed (1919 and 1909), sugar-beet seed (1919), and anise seed and golden-seal seed (1909).
[5] The 1919 figures represent vegetables raised for sale only.
[6] In 1909 the value of the farm garden was largely included in the value of "Other vegetables."
[7] Includes chufas, hemp, chicory, ginseng, mint, teasels, and willows (1919 and 1909), and cassava (1919).
[8] Includes apples, peaches, pears, plums and prunes, cherries, apricots, and small quantities of quinces.
[9] The 1909 figures include the value of wild nuts (black walnuts, butternuts, hickory nuts, etc.), which were not reported for 1919.

[1] A minus sign (—) denotes decrease. Per cent not shown when more than 1,000.
[2] Due partly to increased production and partly to higher prices.
[3] Increase in value on basis of 1909 prices for 1919 crops. The percentages in this section represent the *net increase in production.*
[4] Excess of actual 1919 values over values computed for 1919 on basis of 1909 prices.
[5] Exclusive of emmer and spelt.
[6] Principally oats and barley, oats and wheat, and wheat and barley grown and harvested together.

BETWEEN 1909 AND 1919 RESULTING (1) FROM GREATER PRODUCTION AND (2) FROM PRICES.

[1] This "gross value of farm products" corresponds approximately with the gross value of products for a manufacturing industry, and for many purposes forms a fairly satisfactory index of the relative importance of agriculture in different areas. It contains, however, a large element of duplication on account of crops fed to live stock, and some further duplication where domestic animals are sold by one farmer to another and resold within the year. The duplication is most serious in states where live-stock products are most important.

[2] The value of domestic animals sold or slaughtered was not called for by the 1920 farm schedule. The estimated value obtained for 1919 was based on the ratio between the animals sold or slaughtered in 1909 and those on hand in 1910, and the changes in the number and average value of comparable classes of animals from 1910 to 1920.

IRRIGATION.

A census of irrigation has been taken as a part of the census of agriculture in each census from 1890 to 1920. The scope of the inquiries was considerably enlarged in 1910, particularly in the matter of sources of water supply and character of enterprises supplying water, making it possible to classify the data collected.

The tables which follow present the most important facts—acreage and cost—for the four censuses from 1890 to 1920, inclusive, and classify the data collected for 1910 and 1920 by source of water supply and by character of enterprise.

An irrigation "enterprise" is an independent irrigation establishment and includes the works for supplying water and the land to which water is supplied or is to be supplied, except that the cost or value of the land is not included in the "capital invested."

The report of crops grown on irrigated land is incomplete to some extent. Enumerators were instructed to mark on the agricultural schedule the crops that were grown on irrigated land, but it was evident from the schedules that these instructions were not always followed. So far as possible the missing information was supplied in the office, but this could not be done in all cases. Consequently, the totals given for acreage harvested, quantity produced, and value are all too small. It is believed, however, that the data given are representative and the averages of yield and value correctly represent the return from irrigated land.

[1] A minus sign (—) denotes decrease.
[2] Decrease due to the building of several reservoirs in connection with irrigation projects.
[3] Less than one-tenth of 1 per cent decrease.
[4] Not reported in 1910.
[5] Does not include cost of operation and maintenance for rice growing districts in Gulf states; consequently figures for 1919 and 1909 are not comparable.

DRAINAGE.

The following statistics relate to the artificial drainage of land in farms, and of other land intended to be used ultimately for agricultural purposes. Drainage was defined, for the census, as the act or process of drawing off an excess of water by underground conduits, pipe, or tile, or by open or covered trenches, for the purpose of improving the condition of the soil and crops. The drainage census divides naturally into two parts, relating to drainage on farms and to drainage enterprises, respectively. The statistics refer to conditions on January 1, 1920, except where otherwise indicated. No census of drainage has been taken heretofore.

Drainage on farms relates to land provided with artificial drainage and thereby actually benefited for growing crops, and to other land in farms that could be made suitable for growing crops by drainage or by drainage and clearing. In most cases, drainage on farms represents work done by individual farm owners, either independently or supplemental to the works of organized drainage enterprises. The statistics for drainage on farms were collected in the general census of agriculture, and are given for all states.

Drainage enterprises comprise public corporations and local improvement districts established under state laws relating to drainage, commercial enterprises draining land for sale, other organizations engaged in extensive land drainage work, and tracts of 500 acres or more drained by individual farm owners. Levee districts or other flood-protection districts are not included unless they have undertaken the construction of open ditches or tile drains. The enterprises in some states include considerable areas of timber and other unimproved land not in farms. The statistics for drainage enterprises were obtained in a special canvass of the enterprises, which did not include any of the states north or east of the Potomac River. In Alabama, Virginia, and West Virginia no enterprises of a public nature were found that had completed or had begun actual construction of drainage works, so those states are omitted entirely from this part of the drainage census. In Michigan no attempt was made to secure statistics concerning drainage done before 1897, owing to the known incompleteness of the information obtainable.

Those enterprises that on January 1, 1920, had completed or had begun actual construction of the drainage works are herein termed "operating enterprises," the others "nonoperating enterprises."

MANUFACTURES.

DEFINITIONS AND EXPLANATION OF TERMS.

This chapter presents in condensed form statistics collected for the census of manufactures of 1919, and comparative figures for prior censuses. It is designed to meet the requirements of those who desire statistics for the United States as a whole, for the principal industries, and for the states, counties, and principal cities. The general report and analytical tables are presented in Volume VIII. The detailed statistics for the different industries in the states, counties, and cities are given in Volume IX, and similar details for the principal industries are contained in the special reports for such industries. The following paragraphs explain the scope of the census and the terms used in presenting the statistics:

Scope of census.—Census statistics of manufactures are compiled primarily for the purpose of showing the absolute and relative magnitude of the different branches of industry covered and their growth or decline. Incidentally, the effort is made to present data throwing light upon character of ownership, size of establishments, both by value of products and average number of wage earners and germane subjects. When use of the data is made it is imperative to note that owing to the limitations of the statistics any attempt made to derive from the figures the average wages, cost of production, or profits is not only futile but misleading.

The census did not cover establishments which were idle during the entire year or for which products were valued at less than $500, or the manufacturing done in educational, eleemosynary, and penal institutions.

Period covered.—The returns relate to the calendar year 1919, or the business year which corresponded most nearly to that calendar year, and cover a year's operations, except for establishments which began or discontinued business during the year.

The establishment.—As a rule, the term "establishment" represents a single plant or factory, but in some cases it represents two or more plants which were operated under a common ownership or for which one set of books of account was kept. If, however, the plants constituting an establishment as thus defined were not all located within the same city, county, or state, separate reports were secured in order that the figures for each plant might be included in the statistics for the city, county, or state in which it was located.

Classification by industries.—The establishments were assigned to the several classes of industries according to their products of chief value. The products reported for a given industry may thus, on the one hand, include minor products different from those covered by the class designation, and, on the other hand, may not represent the total product covered by this designation, because some of this class of product may be made in establishments in which it is not the product of chief value.

Selected industries.—The general tables at the end of this chapter give the principal facts separately for the industries and the states. A selection has been made of certain leading industries for more detailed consideration.

Comparisons with previous censuses.—Owing to changes in industrial conditions it is not always possible to classify establishments by industries in such a way as to permit accurate comparison with preceding censuses. At the census of 1909 the figures for kindred industries were combined. This practice has been followed in compiling the statistics for 1919 and 1914 when placed in comparison with those for 1909 and prior years.

Influence of increased prices.—In comparing figures for cost of materials, value of products, and value added by manufacture in 1919 with the corresponding figures for earlier censuses, account should be taken of the general increase in the prices of commodities during recent years. To the extent to which this factor has been influential the figures fail to afford an exact measure of the increase in the volume of business.

Persons engaged in the industry.—The following general classes of persons engaged in the manufacturing industries were distinguished: (1) Proprietors and firm members, (2) salaried officers of corporations, (3) superintendents and managers, (4) clerks (including other subordinate salaried employees), and (5) wage earners. In the reports for the censuses of 1904 and 1899 these five classes were shown according to the three main groups: (1) Proprietors and firm members, (2) salaried officials, clerks, etc., and (3) wage earners. In comparative tables covering the census of 1904 it is of course necessary to group the figures according to the classification that was employed at the earlier censuses.

The number of persons engaged in each industry, segregated by sex, and, in the case of wage earners, also by age (whether under 16 or 16 and over), was reported for a single representative day. The 15th of December was selected as representing for most industries normal conditions of employment, but where this date was not a representative day an earlier date was chosen.

In the case of employees other than wage earners the number thus reported for the representative date has been treated as equivalent to the average for the year, since the number of employees of this class does not ordinarily vary much from month to month. In the case of wage earners the average has been obtained in the manner explained in the next paragraph.

In addition to the more detailed report by sex and age of the number of wage earners on the representative date, a report was obtained of the number employed on the 15th of each month, by sex, without distinction of age. From these figures the average number of wage earners for the year has been calculated by dividing the sum of the numbers reported for the several months by 12. The importance of the industry as an employer of labor is believed to be more accurately measured by this average than by the number employed at any one time or on a given day.

The number of wage earners reported for the representative day, though given in certain tables for each separate industry, is not totaled for all industries combined for any state, because, in view of the variations of date, such a total is believed not to be significant. It would involve more or less duplication of persons working in different industries at different times, would not represent the total number employed in all industries at any one time, and would give an undue weight to seasonal industries as compared with industries in continual operation. This total, however, is shown for the different cities, because the limited area and greater regularity of employment largely overcame the objection incident to its publication for the separate states or the United States.

In order to determine as nearly as possible the age distribution of the average number of wage earners for a given state as a whole, the per cent distribution by age of the wage earners in each industry for December 15, or the nearest representative day, has been calculated from the actual numbers reported for that date. The percentages thus obtained have been applied to the average number of wage earners for the year in that industry to determine the average numbers 16 years and over, and under 16, employed. These calculated averages for the several industries have been added to give the average distribution for each state as a whole and for the entire country.

Salaries and wages.—Under these heads are given the total payments during the year for salaries and wages, respectively. The Census Bureau has not undertaken to calculate the average annual earnings of either salaried employees or wage earners. Such averages would possess little real value, because they would be based on the earnings of employees of both sexes, of all ages, and of widely varying degrees of skill. Furthermore, so far as wage earners are concerned, it would be impossible to calculate accurately even so simple an average as this, since the number of wage earners fluctuates from month to month in every industry, and in some cases to a very great extent. The Census Bureau's figures for wage earners, as already explained, are averages based on the number employed on the 15th of each month, and while representing the number according to the pay rolls to whom wages were paid on that date, no doubt represent a larger number than would be required to perform the work in any industry if all were continuously employed during the year.

Prevailing hours of labor.—No attempt was made to ascertain the number of wage earners working a given number of hours per week. The inquiry called merely for the prevailing practice followed in each establishment. Occasional variations in hours in an establishment from one part of the year to another were disregarded, and no attention was paid to the fact that a few wage earners might have hours differing from those of the majority. All the wage earners of each establishment are therefore counted in the class within which the establishment itself falls. In most establishments, however, practically all the wage earners work the same number of hours, so that the figures give a substantially correct representation of the hours of labor.

Capital.—The instructions on the schedule for securing data relating to capital were as follows:

"The answer should show the total amount of capital, both owned and borrowed, on the last day of the business year reported. All the items of fixed and live capital may be taken at the amounts carried on the books. If land or buildings are rented, that fact should be stated and no value given. If a part of the land or buildings is owned, the remainder being rented, that fact should be so stated and only the value of the owned property given. Do not include securities and loans representing investments in other enterprises."

These instructions were identical with those employed at the censuses of 1914 and 1909. The data compiled in respect to capital, however, at both censuses, as well as at all preceding censuses of manufacturers, have been so defective as to be of little value except as indicating very general conditions. In fact, it has been repeatedly recommended by the census authorities that this inquiry be omitted from the schedule. While there are some establishments whose accounting systems are such that an accurate return for capital could be made, this is not true of the great majority, and the figures therefore do not show the actual amount of capital invested.

Materials.—The statistics as to the cost of materials relate to the materials used during the year, which may be more or less than the materials purchased during the year. The term "materials" covers fuel, rent of power and heat, mill supplies, and containers, as well as materials which form a constituent part of the product.

Rent and taxes.—The taxes include certain Federal taxes and state, county, and local taxes. Under "Federal taxes" there are included the internal revenue tax on manufactures (tobacco, beverages, etc.), excise taxes when included in values reported for products, corporation capital stock tax, and corporation income tax, but not the income tax for individual and partnership establishments.

Value of products.—The amounts given under this heading represent the selling value or price at the factory of all products manufactured during the year, which may differ from the value of the products sold.

Value added by manufacture.—The value of products is not always a satisfactory measure of either the absolute or the relative importance of a given industry, because only a part of this value is actually created by the manufacturing processes carried on in the industry itself. Another part, and often by far the larger one, represents the value of the materials used. For many purposes, therefore, the best measure of the importance of an industry, from a manufacturing standpoint, is the value created by the manufacturing operations carried on within the industry. This value is calculated by deducting the cost of the materials used from the value of the products. The figure thus obtained is termed in the census reports "value added by manufacture."

Cost of manufacture and profits.—The census data do not show the entire cost of manufacture, and consequently can not be used for the calculation of profits. No account has been taken of depreciation or interest, rent of offices and buildings other than factory or works, insurance, ordinary repairs, advertising, and other sundry expenses.

Primary horsepower.—This item represents the total primary power generated by the manufacturing establishments plus the amount of power, principally electric, rented from other concerns. It does not cover the power of electric motors taking their current from dynamos driven by primary power machines operated by the same establishment, because the inclusion of such power would obviously result in duplication. The figures for primary horsepower represent the rated capacity of the engines, motors, etc., and not the amount of power in actual daily use.

Fuel.—Statistics of the quantity of fuel used are shown only for anthracite and bituminous coal, coke, fuel oils, gasoline and other volatile oils, and gas—natural and manufactured, and represent the quantity used during the year. As only the principal kinds of fuel are shown, comparison as to the total cost of all fuel is impracticable. A comparison, however, of the total quantities of the several kinds of fuel used in 1919 and 1914 is given.

TABLE 20.—CHARACTER OF OWNERSHIP, BY INDUSTRIES: 1919.

[NOTE.—In some industries, in order to avoid disclosing the returns for individual establishments, the figures for certain groups (represented by only one or two establishments) have been consolidated with those for some of the larger groups. In such case an (x) is placed in the column from which the figures have been omitted, and the figures for the groups with which they have been consolidated are printed in italics. In the totals for all industries combined, each establishment is classified under its proper group; consequently the sum of the figures presented in any given column does not equal the total at the head of the column, except in number of establishments.]

Pounds	4,684,611		
Value	$1,467,665		
Other: Hydrocyanic (Prussic) acid, cyanides of copper, gold, mercury, nickel, potassium, silver, sodium, and zinc; cyanogen, chloride, dicyandiamine, thiocyanates of ammonium, barium, and sodium, value	$5,647,777	$2,398,674	$1,941,893
Other ammonium compounds:			
Inorganic.—Ammonium alums, ammonium chrome alums; carbonate, hypophosphate, nitrate, persulfate, phosphate, sulfide, vanadate, and miscellaneous	$2,759,616		
Organic.—Acetate, benzoate, dimethylamine, hexamethylenetetramine, oxalate, and valerate	$311,115	$260,801	(1)

[1] Figures not available.

[2] Includes for 1919, chlorosulphonic, chromic, hydrobromic, hydrofluosilicic, hypophosphorous, molybdic, silicic, sulphurous, tungstic, vanadic, etc., and for 1914, sulphurous, hypophosphorous, arsenic, and hydrofluosilicic.

[3] Includes for 1919, butyric, caproic, carbolic, cresylic, formic, gallic, glycerophosphoric, hydrocyanic, monochloracetic, oxalic, phthalic anhydride, propionic, pyrogallic, thymic, valerianic, etc.

[4] Product of the chemical and manufactured gas industries. The production of anhydrous ammonia by the by-product coke ovens, as reported by the Geological Survey (mainly ammoniacal liquor and sulphate sold on pound basis of NH_3) was as follows: 1919, 34 establishments, 51,646,764 pounds, value, $5,692,950; 1914, 25,370,509 pounds, value, $2,300,137.

[5] Product of the chemical, fertilizer, and manufactured gas industries. The production of ammonium sulphate by the by-product coke ovens, as reported by the Geological Survey, was as follows: 1919, 36 establishments, 544,231,985 pounds; sales, 557,619,631 pounds, value, $21,075,718; 1914, ammonium sulphate or reduced to equivalent in sulphate, 170,763,906 pounds, value, $4,696,590.

TABLE 88.—COMPARATIVE SUMMARY FOR THE UNITED STATES, BY INDUSTRIES: 1919 AND 1914.

NOTE.—The figures for some industries do not represent the total production, because important establishments that manufacture the same class of products may be included in other industries. (See Explanation of terms.)

Primary horsepower includes power generated in manufacturing establishments plus electric and other power rented from outside sources; it does not include electric power generated by primary units of the establishments reporting.

MINES AND QUARRIES.

DEFINITIONS AND EXPLANATION OF TERMS.

This chapter presents in condensed form statistics collected for the census of mines and quarries of 1919, and comparative figures for prior censuses. It is designed to meet the requirements of those who desire statistics for the United States as a whole, for the principal mining industries, and for states. The general report and analytical tables, and also detailed statistics for the states and selected industries are contained in the special report of mines and quarries Volume XI. An explanation of the terms used in the accompanying tables is given below.

Scope of census.—Census statistics of mines and quarries, and petroleum and natural-gas wells are compiled primarily for the purpose of showing the absolute and relative magnitude of the different branches of industry covered and their growth or decline. Incidentally, the effort is made to present data throwing light upon character of ownership, size of enterprises, and similar subjects. When use is made of the statistics it is imperative that due attention be given to their limitations, particularly in connection with any attempt to derive from them figures purporting to show average wages, cost of production, or profits.

The census did not cover enterprises which were idle, that is, in which neither productive work nor development work was done during the entire year; or enterprises the products of which were valued at less than $500, or in the case of the bituminous coal mining industry, producing less than 1,000 tons; or, if not productive, in which development work amounting to less than $5,000 was done.

Period covered.—The returns relate to the calendar year 1919, or the business year which corresponded most nearly to that calendar year, and cover a year's operations, except for enterprises which began or discontinued business during the year.

The enterprise.—The term enterprise represents one or more mines and quarries, wells or groups of wells, or natural-gas gasoline plants all within the same state operated under a common ownership or unified control, or for which only one set of books of account was kept, and for which a single report was secured. It may cover plants at several localities within the same state. If plants under unified control were not all located within the same state, separate reports were secured in order that statistics for the several enterprises thus defined might be included in statistics for the states in which they were located. The enterprise is further defined as being limited to a single industry. Separate reports were secured with very few exceptions for each industry conducted by an operator, and only where combined reports on two or more industries could not be separated does a single enterprise cover more than one industry. The number of enterprises shown in the tables is equivalent to the number of individual reports tabulated.

Number of mines, quarries, wells, and plants.—Under these designations is given the count of the number of mines, quarries, wells, and gasoline plants shown by the returns received. The unit of enumeration for mines and quarries was difficult to define. As a rule each group of workings at a given locality in which operations were conducted as a unit or were unified by common management or joint handling of some part of the mining process, has been considered as a single mine or quarry. Many individual openings, therefore, are not counted as individual mines. The total number reported comprises those in operation or in the course of development during the year 1919. For petroleum and natural-gas wells the individual wells were counted and the total number productive December 31, 1919, was reported. The number of natural-gas gasoline plants is the total number reported in operation during the year.

Classification by industries.—The enterprises reported have been grouped by industries according to the kind of products. Only a few enterprises made consolidated reports covering more than one kind of product. In such cases classification was determined by the product of chief value.

Influence of increased prices.—In comparing figures for cost of supplies and materials, and value of products, with the corresponding figures for earlier censuses, account should be taken of the general increase in the prices of commodities during recent years. To the extent to which this factor has been influential the figures fail to afford an exact measure of the increase in the volume of business.

Persons engaged in the industries.—The following general classes of persons engaged in the mines and quarries and petroleum and natural-gas industries were distinguished: (1) Proprietors and firm members, (2) salaried officers of corporations, (3) superintendents and managers, (4) technical employees, (5) clerks (including other subordinate salaried employees), and (6) wage earners. In the reports for the census of 1909 the fourth class, technical employees, was not distinguished and was probably included with other salaried employees.

The number of persons engaged in each industry, segregated by occupation, sex, and, in the case of wage earners, also by age (whether under 16 or 16 and over), was reported for a single representative day. The 15th of December was selected as representing for most industries normal conditions of employment, but where this date was not a representative day report for another date was requested.

The number of employees other than wage earners thus reported for the representative date has been treated as equivalent to the average for the year, since the number of employees of this class does not ordinarily vary much from month to month. The average number of wage earners has been obtained in the manner explained in the next paragraph.

In addition to the more detailed report by occupation, sex, and age of the number of wage earners on the representative date, a report was obtained of the number employed on the 15th of each month, without distinction of sex or age. From these figures the average number of wage earners for the year has been calculated by dividing the sum of the numbers reported for the several months by 12. The importance of the industry as an employer of labor is believed to be more accurately measured by this average than by the number employed at any one time or on a given day.

The number of wage earners reported for the representative day is given in the table of detailed statistics for the industries, in connection with the classification of wage earners by occupation which was made for the representative day. This number is not used in any other way because, in view of the unavoidable variations of date, such a total is believed to be less significant than the average number. It would involve more or less duplication of persons working in different industries at different times, would not represent

the total number employed in all industries at any one time, and would give undue weight to seasonal industries as compared with industries in continuous operation.

Salaries and wages.—Under these heads are given the total payments during the year for salaries and wages, respectively. The Census Bureau has not undertaken to calculate the average annual earnings of either salaried employees or wage earners. Such averages would possess little real value, because they would be based on the earnings of employees of both sexes, of all ages, in different occupations, and of widely varying degrees of skill. Furthermore, so far as wage earners are concerned, it would be impossible to calculate accurately even so simple an average as this, since the number of wage earners fluctuates rapidly and irregularly in every industry, and in some to a very great extent from day to day. The Census Bureau figures for wage earners, as already explained, are averages based on the number employed on the 15th of each month and while representing the number according to the pay rolls to whom wages were paid on that date, no doubt represent a larger number than would be required to perform the work in any industry if all were continuously employed during the year.

Prevailing hours of labor.—No attempt was made to ascertain the number of wage earners working a given number of hours per week. The inquiry called merely for the prevailing practice followed in each enterprise. Occasional variations in hours in an establishment from one part of the year to another were disregarded, and no attention was paid to the fact that a few wage earners might have hours differing from those of the majority. All the wage earners of each enterprise are therefore counted in the class within which the enterprise itself falls. In most enterprises, however, practically all the wage earners work the same number of hours, so that the figures give a substantially correct representation of the hours of labor.

Capital.—The instructions on the schedule for securing data relating to capital were as follows: "The answer should show the total amount of capital, owned and borrowed, invested by the operator in the enterprise on the last day of the business year reported. *Do not* include securities and loans representing investments in other enterprises." These instructions were identical with those employed at the Census of 1909. The reports received in respect to capital, however, at both censuses, have in so many cases been defective that the data compiled are of value only as indicating very general conditions. While there are some enterprises maintaining accounting systems such that an accurate return for capital could be made, this is not true of the great majority, and the figures therefore do not show the actual amount of capital invested.

Expenses.—The expenses reported in the Census of 1919 include salaries and wages; the cost of supplies, materials, and fuels, including the freight on these; cost of power purchased; the cost of contract work; royalties and rents paid; and taxes paid or assessed. The Census of 1909 reported in addition to the items of expenses covered by the present census all other items of expense incident to that year's business except interest on indebtedness, dividends, and allowances for depreciation.

Supplies and materials, fuel, and power.—Statistics as to supplies and materials, fuel, and power relate to the cost of these used during the year, which may be more or less than the amount purchased during the year. The term "supplies and materials" covers mine, mill, quarry, and well supplies, and ores, coal, and natural gas purchased for treatment, resale, or distribution.

Contract work.—The amounts reported under this head include expenditures for both productive operations and those prosecuted for development only; they are in effect indirect expenditures for salaries, wages, supplies and materials, fuel, and power.

Royalties and rents.—The amounts given under this head represent the payment to fee holders or the value of share of product credited to fee holders for mineral output from leased land and also rents paid for plants, equipment, and privileges or easements.

Taxes.—The taxes include Federal capital stock; corporation income, and excess profits tax; and also state, county, and local taxes. The data compiled in respect to Federal taxes are very defective largely for the reason that many mining corporations are engaged in other business and have sources of income other than from mining and do not pay Federal taxes on mining separately. For many of these corporations no data have been obtained; for others satisfactory segregation of mining could not be made.

Expenditures for development work.—The expenses reported as defined above include costs of both productive operation and development work. In the statistics on producing enterprises that part of the expenses for salaries, wages, contract work, supplies and materials, fuel, and power which was credited by the mine operators to development work is shown as expenditures for development work. In the statistics for nonproducing enterprises the total of all these expenses is given as expenditure for development work.

Value of products.—The amounts given under this heading represent the selling value at point of production or f. o. b. at point of shipment, or such other value as may represent the net value or amount received for the product mined in 1919 under the terms by which it was disposed of, and also includes the value at point of production of products used by the operating company.

Cost of mining and profits.—The census data do not show the entire cost of mining and well operations, and consequently can not be used for the calculation of profits. No account has been taken of depreciation or interest; rent of offices and buildings other than those connected with mine or quarry operation; insurance, selling, and other sundry expenses.

Lands controlled.—The inquiry on land tenure was confined to land pertaining to the mining or well operations covered by the report. In many of these, however, land held in reserve for future development and for speculative or other purposes not pertaining to mining was included in the returns, and also a large number of more or less unsatisfactory estimates were included. Nevertheless, it is believed that the data presented reflect fairly the conditions as to land tenure in the mining industries, and show correctly the order of magnitude of land holdings pertaining to mining enterprises.

Power used.—The item, aggregate horsepower, represents the horsepower of prime movers used by the enterprises for generating power plus horsepower of motors, principally electric, and of other equipment operated by power purchased from other concerns. It does not cover the power of electric motors taking their current from generators operated by prime movers reported by the same enterprise (such equipment is reported separately), because its inclusion would obviously result in duplication. The figures on power represent the rated capacity of the engines, motors, etc., and not the amount of power in actual daily use.

Fuel.—Statistics of the quantity of fuel used are shown only for anthracite and bituminous coal, coke, wood, oil, and gas. They relate to the quantity used during the year, which may be more or less than the quantity purchased. As only the principal varieties of fuel are shown, no comparison can be made with the total cost of all fuel.

[1] Operators, not enterprises in 1909.

[2] The totals for all industries include, besides those specified, statistics for the chromite industry in 1919 and for the borax, chromite, grindstone, marl, monazite, and zircon, peat, and precious stones industries in 1909, for which comparable figures could not be given. The value of products of these industries was less than one-tenth of 1 per cent of the total for all industries in 1919 and one-tenth of 1 per cent in 1909.

[3] Includes $632,000 which could not be distributed among the stone industries.
